

How to Publish Your NBA App to the Internet for Free

To get a shareable link (e.g., <https://your-nba-app.streamlit.app>), you will use **Streamlit Community Cloud**. It connects directly to GitHub to host your code.

Step 1: Create a GitHub Account & Repository

1. Go to [GitHub.com](https://github.com) and create a free account (if you don't have one).
2. Create a new "Repository" (think of this as a cloud folder for your project). Name it something like `nba-analytics-project`.
3. Make sure the repository is set to **Public** so Streamlit can read it.

Step 2: Upload Your Files to GitHub

Upload the following files to your new GitHub repository:

1. `app.py` (The main Python script we created).
2. `requirements.txt` (The file generated alongside this guide).
3. **Data Files: Crucial Step!** Once your partner finishes their data analysis, they will likely have `.csv` files containing the NBA data. You must upload these `.csv` files to this GitHub repository as well, or your deployed app won't be able to find the data.

Step 3: Connect to Streamlit Community Cloud

1. Go to share.streamlit.io and sign up. Choose "Continue with GitHub" so it can access your repository.
2. Once logged in, click the big "New app" button.

Step 4: Deploy

You will see a form asking for three things:

- **Repository:** Select the repository you created in Step 1 (e.g., `yourusername/nba-analytics-project`).
- **Branch:** Leave this as `main` (or `master`).
- **Main file path:** Type `app.py` (since that is the name of your Streamlit script).

Click **Deploy!**

What Happens Next?

Streamlit will read your `requirements.txt` file, install Pandas, Plotly, and Streamlit on their servers, and then launch your `app.py` file.

Within 1-2 minutes, you will be given a custom, permanent URL. Anytime you or your partner upload a new version of `app.py` or new `.csv` data to GitHub, the live website will automatically update!
